Reproduction

In one important respect, the reproductive functions in living things: it is not necessary that any one of the reproductive organs be moved, and the individual may still be a member of the reproductive system in all members of the species. However, the species would be able to preserve the species rather than the individual. Through natural selection over millions of years, the basic patterns of sexual reproduction have become most complex.

Essential Feature

13-1 Sexual reproduction involves the fusion of two nuclei. The essential feature of sexual reproduction is the fusion of the nuclei of two separate cells to form offspring. The combination of these nuclei results in a new combination of chromosomes in the offspring. Theoretically, sexual reproduction permits an almost endless number of combinations.
